I. Problem Statement:

The Java Spring Boot Expense Tracker empowers users to efficiently manage personal and group expenses. It features robust user authentication, role-based access control, and notification alerts for enhanced security and user engagement. Group management functionalities enable users to create, manage, and analyze shared expenses collaboratively. The application boasts an intuitive interface, responsive design, and interactive visualization tools for seamless navigation and insightful expense analysis. Leveraging modern technologies and frameworks, it sets a new standard in expense management, prioritizing convenience, security, and usability.

II. Features:

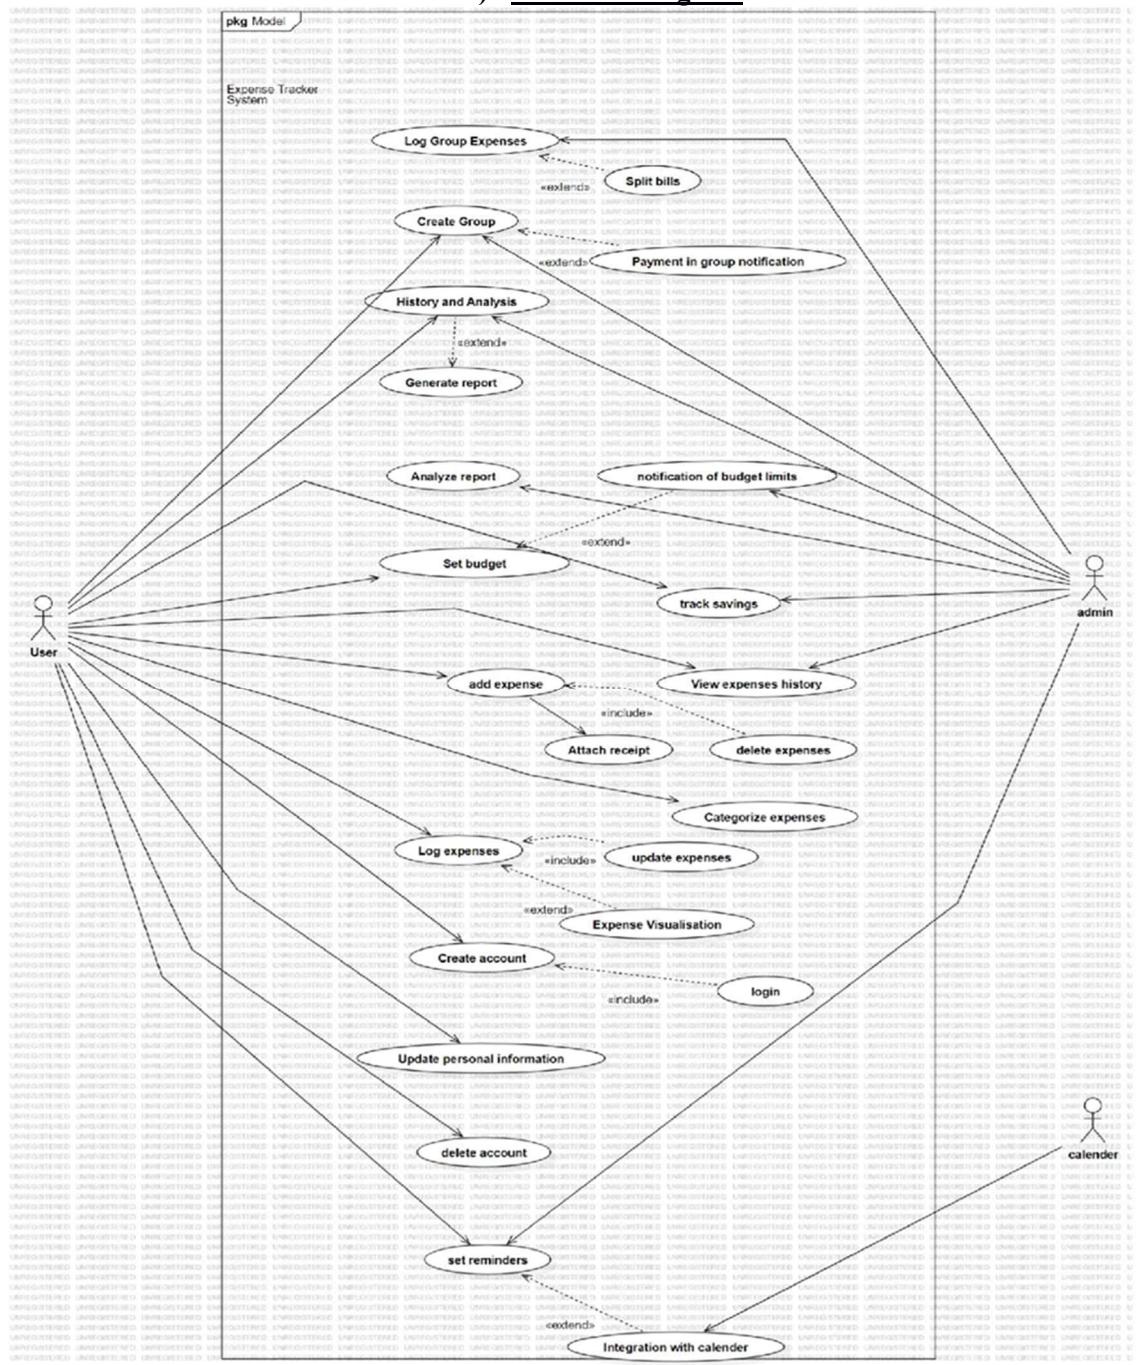

1. User Authentication and Authorization:
 - Allow users to register and log in securely to the application.
2. Personal Expense Management:
 - Enable users to record personal expenses, including details such as date, amount, category, and description.
 - Provide options for categorizing expenses (e.g., food, transportation, utilities, etc.).
 - Allow users to view, edit, and delete their expenses.
 - Implement charts or graphs to visualize personal spending patterns over time.
3. Group Expense Management:
 - Allow users to create groups for managing shared expenses among group members.
 - Provide features for adding and removing group members.
 - Implement functionalities for viewing group expenses.
4. Notification System:
 - Implement a notification system to alert users about upcoming payments, expense approvals, or other relevant activities.
 - Provide options for users to customize notification preferences based on their needs.
5. Financial Reports and Analysis:
 - Generate periodic financial reports summarizing expenses.
 - Implement analytical tools to identify spending trends, categories with the highest expenditure, etc.
 - Allow users to set budget limits and receive alerts when approaching or exceeding predefined thresholds.
6. User Interface and Experience:
 - Design an intuitive and user-friendly interface for easy navigation and interaction.

- Ensure responsiveness across various devices (desktop, tablet, mobile) for a seamless user experience.
- Provide search and filtering functionalities to quickly locate specific expenses or transactions.

Expense Tracker & Management

IV. Architecture Pattern

MVC Architecture Implementation Report

Our Java Spring Boot application employs the MVC architecture pattern to organize code into three primary concerns: models, views, and controllers. This pattern enhances maintainability, scalability, and separation of concerns. Below is an overview of each component within our application structure:

Model Components:

- Budget: Represents the budget data and its related operations.
- Expense: Encapsulates details and operations for individual expenses.
- ExpenseCategory: Defines categories for expenses.
- ExpenseGroup: Manages group-related data for expenses.
- ExpenseTransactionType: Enumerates the types of expense transactions.
- Gender: Enumerates gender types for user profiles.
- GroupExpense: Relates to expenses shared among a group of users.
- GroupMember: Represents members within an expense group.
- IncomeSource: Describes the sources of income for users.
- User: Represents user details and their related operations.

Controller Components:

- AuthController: Manages authentication-related processes, such as login and registration.
- BudgetController: Handles HTTP requests regarding budget management.
- ExpenseController: Processes requests related to expense tracking.
- GroupMemberController: Oversees actions specific to group members within the application.
- IncomeSourceController: Manages income sources for users, including CRUD operations.
- UserController: Deals with user-related requests, such as fetching and updating user profiles.

Notification Subsystem (Part of Controller or Service Layer):

- BudgetOverlimitNotification: A specific type of notification related to budget limits.
- NotificationManager: Orchestrates the sending of notifications.
- NotificationStrategy: Defines the strategy for notification delivery.
- RecurrentBillNotification: Handles notifications for recurring bills.

Repository Components:

- BudgetRepository: Interfaces with the database for budget-related data operations.
- ExpenseGroupRepository: Manages data access for expense groups.
- ExpenseRepository: Abstracts the data layer for expense management.
- ExpenseRepositoryImplementation: Provides a concrete implementation of the ExpenseRepository.
- GroupExpenseRepository: Facilitates data operations for group expenses.
- GroupMemberRepository: Handles data persistence for group member information.

View Components:

- HTML Templates: Our application uses Thymeleaf templates to render the server-side UI. Key templates include:
 - `adddexpense.html`: UI for adding expenses.
 - `groupmanagement.html`: Interface for group-related activities.

- `incomeSources.html`: Display and manage user income sources.
- `profile.html`: User profile page.
- `error.html`, `login.html`, `register.html`: Standard authentication and error pages.
- *Additional HTML files* corresponding to various functionalities within the application.

Data Layer:

- SQL Database: The application relies on an SQL database for persistent storage, utilizing JPA repositories for data access and manipulation.

DTOs:

- Data Transfer Objects: Classes such as `UserLoginDto`, `UserRegistrationDto`, and `IncomeSourceDTO` are used to transfer data between the client and server, optimizing the data payload and enhancing security.

The application leverages the MVC architecture to separate the user interface, business logic, and data access layers, ensuring a clear division of responsibilities. The models define the core data structures, controllers manage request handling, and views are rendered using server-side templates. Additionally, a notification system is incorporated for alerts, and data persistence is achieved through an SQL database, with data transfer objects facilitating secure data exchange.

V. Design Principles:

1. Group Expense Management

Design Principle: Single Responsibility Principle

Since the module deals with managing group-related functionalities such as creating groups, adding members, managing expenses within groups, and retrieving group data, adhering to SRP ensures that each class or component within the module has a single responsibility. This helps keep the codebase organized, maintainable, and easier to understand, as each part of the system is focused on a specific task. Additionally, it facilitates easier testing and future enhancements to the module.

2. Expense Management

Design Principle: Single Responsibility Principle (SRP)

In our Expense Management system, the Expense class and ExpenseRepository exemplify the SRP by adhering strictly to managing expense-related operations:

Expense Class: This class encapsulates the attributes and behaviors related to an expense. It focuses solely on representing an individual expense entity, ensuring that any changes to expense-related attributes or behaviors will affect only this class.

ExpenseRepository: This class is responsible for the persistence and retrieval of expense data from a data source, like a database or a file system. By dedicating itself to data storage and retrieval tasks exclusively, it adheres to the SRP, ensuring that any modifications related to data persistence will not affect the business logic or representation of an expense.

3. Design Principle: High Cohesion in Notification Management

The NotificationManager and NotificationStrategy classes in the Expense Management system demonstrate high cohesion by focusing on specific and related responsibilities. The NotificationManager oversees the management and orchestration of notifications, while NotificationStrategy defines individual notification methods. This design promotes maintainability, readability, and flexibility, allowing for easy updates or additions to notification strategies without impacting other system components.

4. Report generation and Virtualisation:

Design Principle: Single Responsibility Principle (SRP)

Report generation:

Separation of Concerns: Functions have distinct roles. fetchExpensesData fetches data, groupExpensesByMonth groups it, and updateTableForMonth handles table updates. This division makes code easier to maintain and test.

Modularity: The code is designed for extensibility. New features can be added without changing existing functionality, thanks to the clear responsibilities of each function.

Virtualisation:

Data and Visualization Separation: Functions for fetching data and rendering visualizations are separate. This allows changes in one area without affecting the other.

Consistent Structure: The clear organization makes it easier to add new visualizations or adjust existing ones without disrupting the code's stability.

5. User Management

Design Principle: Single Responsibility Principle (SRP)

In our User Management module, SRP is exemplified through the distinct roles assigned to each component: UserController: Manages HTTP request handling exclusively, delegating all business logic to the service layer. This controller is solely responsible for routing and responding to user-related HTTP requests. UserService: Handles all business operations related to users, such as validation, registration, and data manipulation, ensuring that the UserController remains streamlined and focused only on communication tasks. This separation enhances clarity and maintainability, as modifications in user management processes or business rules will primarily involve changes in the UserService without affecting the UserController.

Service Layer Design Design Principle: Dependency Inversion Principle (DIP)

The application's service layer demonstrates DIP by interacting through interfaces rather than concrete implementations, promoting flexibility and decoupling: UserService and UserRepository: The UserService depends on the UserRepository interface to abstract the details of data access implementations. This setup allows the UserService to remain unchanged even if the underlying data access techniques or technologies evolve. Implementing DIP facilitates easier unit testing and future upgrades or replacements of data access layers, contributing to a more robust and adaptable application architecture.

VI. Design Patterns:

Notification Management

Design Pattern: OBSERVER

The Observer pattern is employed to implement the notification feature within the application, chosen specifically for its ability to provide flexibility and extensibility in notification generation. This design approach fosters extensibility and reusability, allowing for the seamless integration of new notification types without altering existing code. Moreover, it promotes a clear separation of concerns by isolating the responsibility for generating notifications from the core application logic. This not only streamlines the maintenance process but also facilitates

easier future extensions. Additionally, the pattern promotes loose coupling, ensuring that the NotificationManager remains agnostic to the specifics of individual notification strategies. Instead, it leverages the NotificationStrategy interface to seamlessly trigger the appropriate notification generation based on the context, enhancing the overall robustness and adaptability of the notification system.

Strategy Pattern: The NotificationStrategy class defines a family of algorithms (or notification methods) and encapsulates each one, allowing them to be interchangeable. This design enables dynamic selection of the appropriate notification method at runtime, offering flexibility and maintainability without altering the NotificationManager or core notification code.

Group Expense Management:

Design Pattern: Observer

- Notifications: Observer pattern facilitates notifying users about events like adding members, quitting groups, or adding expenses, ensuring timely updates and user engagement.
- Decoupling: By decoupling the subject (e.g., group or expense) from its observers (e.g., UI components or services), Observer pattern enables flexible and maintainable interactions between different system components.
- Dynamic Updates: With Observer pattern, UI elements and other components receive automatic updates upon changes in group or expense states, ensuring real-time responsiveness without manual intervention.
- Scalability: Observer pattern allows easy scalability by accommodating new features or events that require notification mechanisms, ensuring the system can evolve and adapt to changing requirements without significant refactoring.

Report generation and Virtualization:

Design Pattern: Observer

The Observer Pattern is demonstrated by attaching event listeners to specific elements and responding to events like button clicks or document loading. For instance, the event listener `document.addEventListener('DOMContentLoaded', function() observes the "DOMContentLoaded" event to initialize fetching of data and setting up further interactions.`

Similarly, there's an event listener on the "Generate Report" button to trigger report generation when clicked, and an event listener on the dropdown for selecting chart types to trigger chart rendering.

VII. Individual Contributions:

Nidhi P G:

Throughout the development phase of the Expense Management project, my primary focus was on the meticulous handling of personal expenses for individual users. I undertook the responsibility of implementing the core functionalities related to personal expenses, which encompassed the operations of adding, viewing, editing, and deleting expenses.

Additionally, I took the lead in establishing the notification management system. This included designing and implementing strategies to deliver timely and relevant notifications to users, tailored to different triggers and conditions.

One of the significant contributions I made was the seamless integration of all project components into a unified application. This entailed ensuring that each module and feature not only functioned independently but also harmoniously interacted with one another. By achieving this integration, I

aimed to enhance the user experience, making the application more intuitive and convenient for users to manage their expenses effortlessly.

In conclusion, my contributions spanned both the individual expense management functionalities and the overarching integration of all project components. Through these efforts, I aimed to deliver a robust, user-friendly, and comprehensive Expense Management system that meets the diverse needs of our users.

Nikita Suresh:

In the project, my contribution primarily focused on developing the group management module within the Expense Tracker application. I spearheaded the design and implementation of features crucial for efficient collaboration, including group creation, member management, and expense-tracking functionalities. Furthermore, I ensured seamless integration of the group management module with the overall application architecture, facilitating smooth interoperability with other essential modules such as user authentication and expense analysis. Through meticulous attention to detail and rigorous testing, my efforts significantly enhanced the application's capability to streamline shared expense management and foster collaborative financial planning among users.

Pramath: User Management

User authentication is crucial for modern web applications, and achieving both security and flexibility can be challenging. This report highlights the Strategy Pattern as an effective solution for creating scalable and secure user authentication systems.

The Strategy Pattern effectively decouples authentication logic from user management, allowing for easy interchange and upgrades of authentication mechanisms without affecting other application areas. It includes three main components:

- Strategy Interface: A common interface for all strategies.
- Concrete Strategies: Implementations of the interface, each with a unique authentication algorithm.
- Context: A class that can dynamically switch strategies.

We implemented two strategies: SimpleAuthenticationStrategy for direct password comparison and HashedAuthenticationStrategy for secure password checking using SHA-256 hashing. Using Spring's dependency injection, these strategies are easily integrated and can be swapped dynamically based on configuration or environmental needs.

Nida Samreen: Report generation and Virtualisation:

My primary focus was on obtaining expense data from the database and organizing it by category. I was responsible for implementing core functionalities for this process, including fetching expenses, calculating monthly totals for each category, and generating relevant reports.

I was also given the responsibility of developing data visualizations for the project. This involved creating pie charts and bar graphs to represent category-wise expenses, providing a more straightforward way to view and analyze the data.

One of the major contributions I made was ensuring the smooth integration of data visualization with the reporting system. This required ensuring that the charts and graphs accurately reflected the calculated data and could easily interact with other components of the project.

VIII. Output Screenshots:

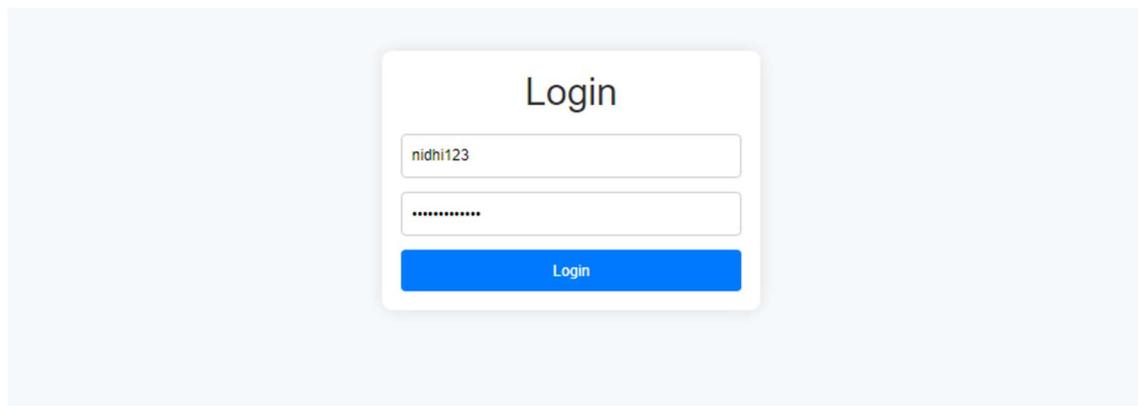

A) Web Application

1) Register Page

The screenshot shows a web browser window with the title bar "Register". The address bar displays "localhost:8080/register". The main content area contains a registration form titled "Register". The form includes fields for "First Name" (Nidhi), "Last Name" (G), "Email" (nidhi123@gmail.com), "Password" (*****), and "Gender" (Female). There are "Register" and "Already have an account?" buttons at the bottom of the form.

2) Login Page

Expense Tracker & Management

3) Home Page

A screenshot of the home page of the Expense Tracker & Management application. The top navigation bar includes links for "Expense Tracker", "Profile", "Income Sources", "Budget Overview", and "Logout". The main content area contains six cards: "View Expenses" (with a "View" button), "Add New Expense" (with an "Add" button), "Notification" (with a "See" button), "Group Management" (with a "Manage" button), "Report" (with a "View" button), and "Virtualisation" (with a "View" button).

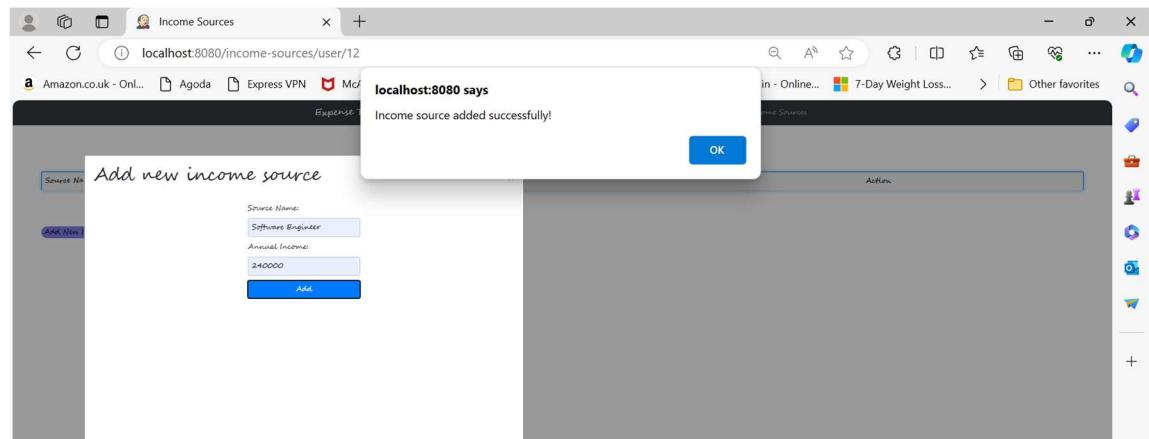

4) Profile Page

A screenshot of the profile page for a user named "Nidhi G". The page displays the user's profile picture, name, and various account details. These details include:

- Username: nidhi1801
- Email: nidhi123@gmail.com
- First Name: Nidhi
- Last Name: G
- Gender: FEMALE

5) Income Sources Page

Expense Tracker & Management

6) Income Sources

A screenshot of the "Income Sources" page. The title bar includes "Expense Tracker" and "Income Sources". The main content shows a table with one row: "Software Engineer" under "Source Name" and "240000.00" under "Annual Income". To the right of the "Annual Income" cell is a red "Delete" button. At the bottom left is a blue "Add New Income Source" button.

7) Add personal Expense Page

A screenshot of the "Add Expense" page. The title bar includes "Expense Tracker" and "Group Management Personal Expenses". The main content is a form titled "Add Expense" with fields for "Expense Date" (set to "2021-01-01"), "Expense Amount" (0.0), "Expense Category" (RENT), "Transaction Type" (ONLINE), and "Receipt" (a file input field showing "Choose File No file chosen"). There is also a "Submit" button.

8) Adding an expense

Expense Tracker & Management

Expense Tracker

Add Expense

Expense Date: 20-04-2024

Expense Amount: 300

Expense Category: GROCERY

Transaction Type: ONLINE

Receipt: Choose File | No file chosen.

Submit

Group Management Personal Expenses

9) View Expenses of the month

All Expenses

localhost:8080/expenses/all/12

Date: 2024-04-20 Amount: 300.0 Category: GROCERY Transaction Type: ONLINE Receipt: View Receipt [Edit] [Delete] [View]
